Introducing GLP Clean Energy

GLP has launched a number of initiatives to help pursue renewable energy development including onsite solar across our global logistics real estate portfolio coupled – when possible – with battery storage and depot charging for electric trucks.

We have about **32 MW** – we are currently building an additional **20 MW** and we have the ambition of delivering **500 MW** in the future.

Introducing **GLP Clean Energy**

GLP has launched a number of initiatives to help pursue renewable energy development including onsite solar across our global logistics real estate portfolio coupled – when possible – with battery storage and depot charging for electric trucks.

Global demand for **clean energy** is leading to increased investment in **sustainable energy** infrastructure transition

The clean energy generated by GLP is sold back to utility companies and customers, reducing the pressure on local electricity grids and positively impacting communities, tying into GLP's overall ESG and sustainability goals.

GLP will **develop, own and operate** the solar projects – thereby **removing the capital cost** constraint **for occupiers**, who will get supplied with **clean energy**.
